

The airspace southeast of Alexandria, Louisiana is approximately 60 nautical miles across either from north to south or east to west. That is a large portion of the entire state of Louisiana and certainly an area that encompasses lands from Alexandria to the Texas border. There is only one airway through this area for pilots to fly who are going to northwest Louisiana or east Texas. Are you going to block that too? How much space does the Army at Fort Polk need? It appears that we are gradually expanding the control of our airspace by government entities and the general aviation pilot is slowly being choked out of existence along with the only reasonably fast means of transportation that does not require taking off shoes and clothes to be examined under a microscope. Find another area to restrict. Leave the airspace intact.
